PROBLEM STATEMENT

Personalized Learning AI Agent

DATASET'25

VIT
CHENNAI

Our solution is a Personalized Learning AI Agent that models student skill mastery using knowledge tracing. It continuously updates a learner profile based on quiz attempts and interactions. The AI agent dynamically selects actions—revise, practice, or advance—and provides personalized recommendations. A backend API handles data processing and mastery computation, while the frontend dashboard visualizes progress, weak topics, and adaptive learning paths.

INNOVATION & USP:

Our system uses multiple AI models to analyze student interactions and preferences across different learning methodologies. By observing how each student responds, the AI personalizes the learning experience exclusively for them, adapting content, practice, and feedback dynamically. This approach goes beyond static recommendations, creating truly individualized, data-driven learning paths that evolve with the student's progress. It ensures higher engagement, faster mastery, and a transformative learning journey.

UNIQUE CONCEPTS IMPLEMENTED:

- Learning Streaks
- Smart Notification
- Personalised Daily Goals
- Progress Visualisation
- Rewards and Badges
- Daily Motivations and Encouragement

API:

- APIs are used to collect learner quiz responses and interaction data from the LMS interface.
- These inputs are processed by the learner modeling and AI decision modules to update skill mastery in real time.
- The APIs then deliver personalized learning recommendations and progress insights back to the frontend dashboard.
